rights movement, political and economic explanations for human rights conditions, and the effects of advocacy efforts concerning human rights. After this class, you will have not only an understanding of the major players and factors influencing human rights, but a base understanding of the social scientific processes which govern human rights conditions and improvements. As such, this class is not a history class or a class on current events. Though current and historical events will be discussed, your grade will not depend on your rote memorization of these events. Instead, the focus will be on understanding the underlying interests of important actors towards human rights, the arenas in which these actors interact, and the rules which govern their interactions. While bio-safety, epidemiology, & laboratory medicine are disciplines that are closely interrelated, they are not always optimally connected on functional & organizational levels. This course will provide an overview of the field of biological safety (shorthand to ‘bio-safety’) & its application to epidemiology & laboratory medicine for the control biological hazards for students at all levels who are interested in the epidemiology of microbial diseases. Students will review biological hazards associated with occupational laboratory acquired infections, & examine select case studies to identify critical bio-safety lapses &
outbreak scenarios of food borne illness using epidemiological tools. The course will teach participants how to perform a comprehensive qualitative risk assessment for the use of bio-hazards in the laboratory & learn how to employ the control strategies to appropriately manage these risks for field epidemiology. This course will also convey the laboratory perspective of public health investigations to field epidemiologists in order to improve collaboration between these disciplines & to enhance the quality of field investigations as well as day-to-day interaction. Course concepts can be applied to the control of bio-hazards during the review of proposed research involving bio-hazards, along with emphasizing protective measures when addressing incidents involving bio-hazards, such as emergency spills or bio-terrorism related events. <td>Environmental justice refers to the ways in which the &quot;cost and benefits&quot; of modern industrial society are distributed among social groups. This course is concerned with justice, not as an abstract concept, and inequality not in terms of numbers in a bank account. Social justice or inequality are lived, embodied experiences. An individual's likelihood of experiencing environmental harm is related to intersecting gender, race and class formations, among other things. Justice or inequality is not only embodied, it also happens in places--national and regional differences matter. In this course we will look at some of the extensive literature documenting the ways in which communities of color and poor communities are subject to disproportionate environmental risks. In addition, we will focus on gender as an important category in understanding environmental inequality.</td>
